SUMMARY

PhD candidate at IIT Delhi who builds real-time computer vision systems that turn camera images into continuous control signals, and validates them with real users. Built a markerless system that let a person with a transradial amputation drive a bionic hand from camera images alone, running on a laptop CPU. Work spans data collection, automatic labelling with foundation models, model training, CPU deployment, closed-loop testing and statistical evaluation.

EXPERIENCE

Doctoral Researcher — RISE Lab, Centre for Biomedical Engineering, IIT Delhi | Oct 2020 – present

Clinical partner: AIIMS New Delhi

- Built a markerless vision pipeline that drove an Aether Zeus bionic hand in real time. A MobileNetV2-FPN segmenter exported to ONNX feeds 11 engineered features to linear and SVR decoders on a laptop CPU. In online testing, a participant with a transradial amputation succeeded in 54 of 54 trials across three degrees of freedom.
- Generated segmentation labels without manual annotation: ran SAM 2.1 on dual cloud GPUs, filtered masks through four quality-control rounds, then distilled them into a 4.2 M-parameter student with a confidence-weighted BCE, Dice and boundary loss. The student reached IoU 0.94 on validation and 0.88 in leave-one-session-out testing across 11 sessions.
- Diagnosed a drop in closed-loop throughput between sessions by replaying recorded video through each combination of segmenter and feature set. The deployed configuration was the most accurate offline, which located the cause in closed-loop holding behaviour rather than in the model.
- Built a single-camera reflective-marker tracker (Canny edges, morphology, CLAHE, area and circularity filtering, ratio-test matching, constant-velocity Kalman filter) with translation-, rotation- and scale-invariant triplet-angle features. It runs online at 12.8 Hz (68.7 ms per frame) with ten markers and about 29 Hz with three. Across 16 users it achieved 90.6–100% task success in 13 non-disabled participants and 98.8% (160 of 162 trials) in 3 participants with transradial amputation.
- Built synchronised multi-sensor acquisition (USB camera, IMU over TCP, data glove) and released an open-source MATLAB toolbox for the xIMU3 IMU (400 Hz streaming).
- Ran and analysed ethics-approved human studies at IIT Delhi and AIIMS New Delhi. Published in *IEEE Sensors Journal*; two manuscripts under review or revision; one invention disclosure filed (FITT, IIT Delhi, 2024).

M.Tech. Researcher — NIT Silchar | 2018 – 2020

- Classified cognitive tasks from EEG with engineered time- and frequency-domain features and an SVM (98% cross-validated accuracy); published at IEEE ASPCON 2020.

SKILLS

Computer vision and ML: PyTorch · segmentation-models-pytorch · OpenCV · SAM 2.1 · ONNX Runtime · scikit-learn · semantic segmentation · object tracking · Kalman filtering · regression
Engineering: Python · MATLAB · real-time capture and control loops · UDP/TCP device interfaces · Git · cloud GPU training (Kaggle, vast.ai)
Evaluation: cross-validation design · closed-loop user testing · Fitts'-law throughput · repeated-measures ANOVA
Currently learning: C++, ROS 2, TensorRT

EDUCATION

Ph.D., Biomedical Engineering — IIT Delhi | Oct 2020 – present | CGPA 8.45/10
M.Tech., Instrumentation Engineering — NIT Silchar | 2020 | CGPA 9.0/10, Distinction
B.Tech., Electronics and Instrumentation Engineering — University of Kalyani | 2018 | CGPA 7.81/10
